

Transtherm[®] packing system

Validated for the safe transport of blood

The temperature of blood transported to customers and between centres should be maintained within the limits prescribed in the UK BTS guidelines (Fig 7.10 Page61).

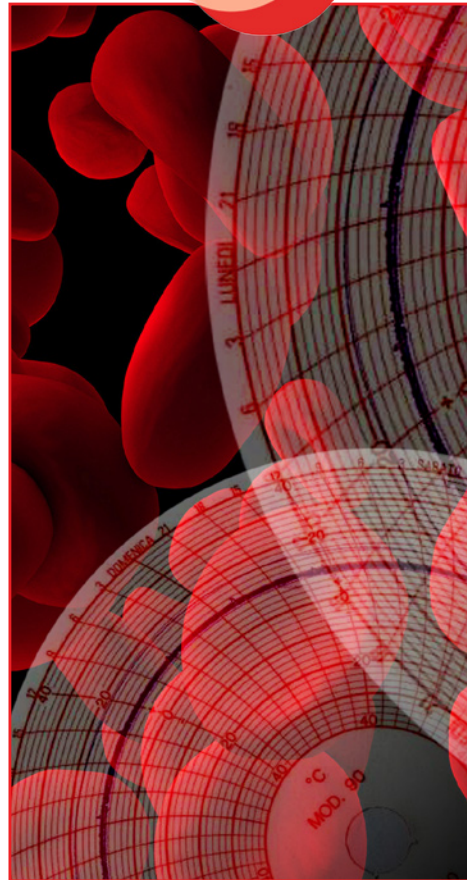

Ensure staff are properly trained and that they are aware of the requirements of this document.

Ensure adequate packing equipment is available including boxes and cool packs.

The maximum transportation times for blood products are shown in the UK BTS guidelines

These can only be achieved if the following conditions are met:

There should be no delay between removing product from its storage area and inserting into the Transtherm[®]. The effect of environmental temperature on packaging times is particularly significant on product normally stored at temperatures of 4°C or below.

Instructions for the use of chill packs

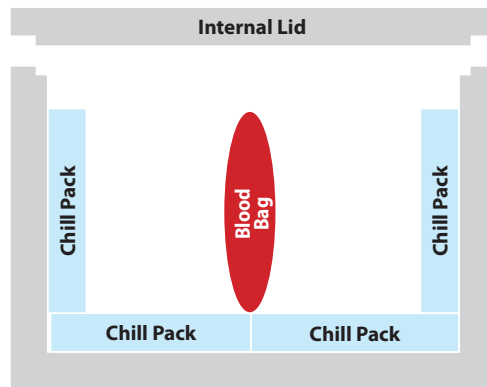

The diagrams opposite illustrate the only method to obtain the stipulated number of hours that each blood bag will retain its temperature.

- Pre-chill each chill pack to a minimum of 5°C before placing into the insulated box.
- Ensure that each blood bag is placed in an upright position and each chill pack is located in position as indicated.
- Keep the handling of blood bags to a minimum to avoid the transfer of body heat to the bag which can result in the blood bags warming quickly.
- Ensure the box lid is correctly positioned and secured.
